

Unique WaterSwitch benefits

Features	Benefits
High Flow design	Can be used for garden watering or multiple uses
LED Indication	Lets you know where your water is coming from
High Pressure	Can be used with sprinklers and two storey homes
Positive selection	Will not provide a mixture of both sources of water
Easy installation	Mounts easily to any Onga Pump – no electrician required. Quick plumbing job
Automatic Operation	No need to check tank levels, or adjust valves

WaterSwitch needs to be installed with a pump. When you connect a pump to your rainwater tank, you can use your water as you would mains supply water. It will have enough pressure to fill your toilet cistern, to operate the washing machine, and to operate your garden sprinklers or watering system.

We all need to use less mains water. With the Onga WaterSwitch, hooking up your rainwater tank to your home is easy.

- Automatic changeover between mains water and your rainwater tank
- High Water Flow
- High Pressure
- Indication of which source you're using
- In built backflow prevention

WaterSwitch

Automatic Rainwater Controller

Saving Water? It's Automatic.

L100102 B 0506

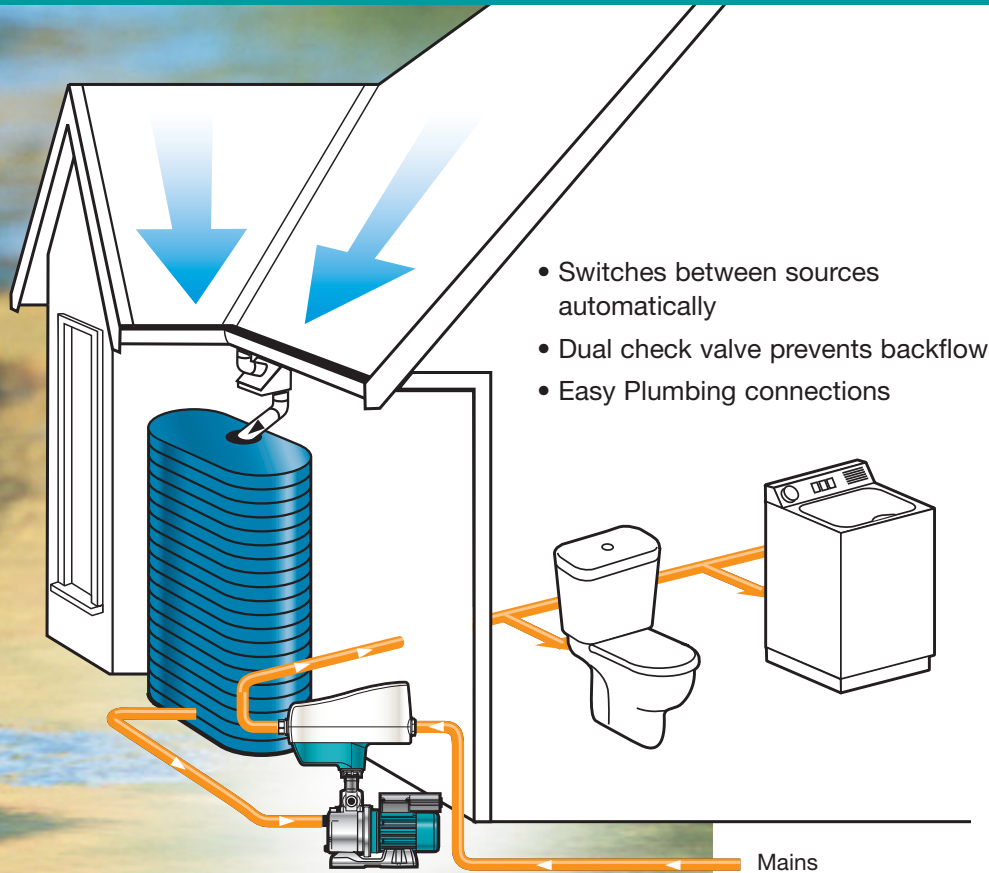

WaterSwitch Conservation made easy

Rainwater is a valuable resource! It can be easily captured and stored in a tank, then used for many purposes around the house.

Not all of our uses require water that has been treated for drinking by your local water utility!

Use your rainwater for:

- The washing machine
- Flushing the toilet
- Washing the car
- Watering the garden

Even the largest rainwater tank will empty from time to time. If your tank is connected to the toilet cistern, the washing machine or your garden tap - you can't afford to be worrying about running out of water.

Making sure you have continuous supply

WaterSwitch knows when your tank is running low, and switches over to mains supply. When your tank has water in it, WaterSwitch changes back to rain water to maximise your conservation of water - all without you having to worry about it

An empty tank is a good tank

Each time you use rainwater, you're leaving water in your city's catchments for use later on. It also leaves space in your rainwater tank to store more water next time it rains.
